

Fraud Awareness for Banking Customers

Phishing attacks often use urgent language, fake login links, or reward claims to trick customers into sharing credentials.

A genuine bank representative will not ask for OTP, MPIN, full card details, or internet banking password over phone, SMS, or email.

If fraud is suspected, customers should block affected channels immediately and raise a complaint with the bank.

Customers should enable transaction alerts so they can detect unusual account activity quickly.

Fraud complaints are easier to investigate when the customer keeps screenshots, timestamps, and reference numbers.
